

Future Scope

The current build already covers the core AI coaching, yoga, nutrition and gamification experience end to end. Here's what we're planning for upcoming releases.

1 Zumba AI

- A dedicated Zumba AI mode is planned, using the same on-device pose-tracking engine to follow dance-style cardio routines.
- Rather than scoring joint angles against a fixed pose, it will measure rhythm and movement consistency — how evenly spaced a user's repeated moves are — to give an "on-beat" accuracy score suited to free-form dance.
- It's planned to sit alongside AI Coach and Yoga AI as a third guided-tracking mode, with its own exercise library entries, XP rewards and Exercise Guide onboarding.

2 Report Analysis for Suggested Exercises

- A planned analytics engine that looks at a user's historical session data — form scores, completed exercises, streak patterns and readiness check-ins — to suggest which exercises or routines to focus on next.
- For example, someone with a consistently lower form score on lower-body exercises would get more squat, lunge or glute-bridge sessions suggested, along with easier variants or the Exercise Guide, until their form improves.
- The same analysis should eventually personalise the dashboard's suggested workout beyond the current goal-and-readiness model, closing the loop between tracked performance and future recommendations.

3 Expanded Premium Options

- Additional Premium tiers and add-ons are planned, to give users more granular choices depending on their needs and budget.
- This includes a wider real-product catalogue in the XP Store, deeper analytics and export options, early access to new AI features like Zumba AI and Report Analysis, and family or group Premium plans that let linked accounts share benefits.

4 Other Roadmap Items

- Moving from local SQLite storage to a cloud-hosted backend and a proper domain, enabling multi-device sync beyond the current Ngrok-based prototype.
- Replacing simulated food-photo recognition with a production computer-vision model.
- Native iOS and Android apps alongside the current responsive web app.
- Extending trilingual naming beyond Yoga AI to the full exercise library, and adding further regional languages.

5 AI Target Muscle Detection

- AI Coach will identify the targeted muscle groups for each exercise.
- It will tell users which muscles are primarily being worked, such as Chest, Shoulders, Biceps, Triceps, Glutes, Quads, Hamstrings and Core.

- It can provide real-time guidance such as “Target: Chest” or “Focus on your Glutes” during a workout.
- This will help users understand the purpose of each exercise and choose workouts according to their fitness goals.

6. Multiple Exercises for the Same Muscle Group

- Users will be able to choose different exercises targeting the same muscle group.
- For example, for Shoulders, FitQuest AI can provide multiple exercise options instead of just one.
- This will allow users to vary their workouts, avoid repetitive routines, and train the same muscle group in different ways.
- AI Coach can recommend suitable exercises based on the user's goal, fitness level and previous performance.

7. AI Challenge Generator — Detailed Future Scope

- Personalized Challenges: AI will automatically create fitness challenges based on the user's fitness level, goals, workout history and activity level.
- Different Challenge Types: Users can receive challenges such as daily, weekly, muscle-specific, strength, cardio, flexibility and consistency challenges.
- Dynamic Difficulty: The AI can adjust the challenge difficulty according to the user's performance. If a user completes challenges easily, the next challenge can become progressively harder.
- Goal-Based Challenges: Challenges can be generated according to specific goals such as weight management, strength building, endurance, flexibility or improving workout consistency.
- Muscle-Specific Challenges: AI can generate challenges for a particular muscle group. For example, selecting Shoulders could generate a 7-day shoulder-focused challenge using different exercises.
- XP & Rewards: Completing challenges can provide XP, achievements, badges and leaderboard points, connecting the feature with FitQuest AI's existing gamification system.
- AI Progress Adaptation: The AI can analyze completed challenges and create the next challenge based on the user's progress, making the experience continuously personalized.

Conclusion

FitQuest AI turns a phone or laptop camera into a real-time personal trainer, pairs it with an approachable, trilingual yoga program and nutrition tracking, and wraps the whole thing in a gamified, social layer that gives people an actual reason to come back the next day. The result is a single, accessible platform that speaks directly to problem statement SIH26196 — helping students and everyday users build, and keep, a consistent, guided fitness habit, without the cost of a personal trainer.

With Zumba AI, performance-based exercise recommendations, and an expanded Premium tier already on the roadmap, we've built FitQuest AI as a modular platform with plenty of room to grow well beyond this first working build.
